

## Chromium-Compensated GaAs X-ray Sensors

March 25-27, 2015 Stanford, CA, US

### Tomsk

Functional Electronics Laboratory (FEL) of Tomsk State University

R&D activities of FEL:

•GaAs:Cr radiation imaging sensors;

- •Nonlinear optic crystal growth (GaSe, ZnGeP<sub>2</sub>);
- •LED based on GaN/GaInN structures.

## X-ray absorption coefficients for Si, GaAs, and CdTe/ Cd<sub>1-x</sub>Zn<sub>x</sub>Te material

### **Technology of HR GaAs**

#### **Electrophysical characteristics**

Material	Conducti- vity	n <sub>o</sub>	p <sub>o</sub>	Electron mobility	Hole mobility
	10 <sup>-9</sup> ×	10⁵ cm⁻³	10⁵ cm-³	μ <sub>n</sub> ,	μ <sub>p</sub> ,
	(Ωcm) <sup>-1</sup>			cm²/ Vs	cm²/ Vs
SI GaAs	6 0	70 100	1 6	5100	340 200
(GaAs:EL2)	0-9	70 - 100	4 - 0	5800	340 - 390
HR GaAs	06 1 1	<b>n</b> 2	120 200	2200	210 220
(GaAs:Cr)	0.0 - 1.1	2 - 3	120-200	4700	210-320

Resistivity distribution through the HR GaAs wafer thickness. Estimation made from current-voltage characteristics of a point contact

512 channels GaAs microstrip detector on ceramic carriers and fan-out for read-out chips

### HR GaAs detector for R&D in field of high energy and nuclear physics

![](_page_41_Figure_1.jpeg)

### Conclusion

It has been shown that the technology of n-GaAs compensation with chromium enables to reach the HR GaAs resistivity values about 1 GOhm\*cm for the wafers with diameter up to 3" and thickness up to 1000 um.

It has been established that the whole volume of the HR GaAs sensor is active.

It has been demonstrated that values of the  $(\mu \cdot \tau)n$  are about  $10^{-4} \text{ cm}^2/\text{V}$ .

It has been shown that the sensors provide a spatial resolution corresponding to the pixel pitch and allow obtaining of high quality X-ray images.

#### Future prospects are:

Design, produce, and testing pilot samples HR GaAs pixel sensors based on 4 inch GaAs wafers

Investigation of long-term stability of HR GaAs pixel sensors under X-ray irradiation

## Thank you for your time !

#### **Band gap modification**

![](_page_44_Figure_1.jpeg)

Analysis of  $CCE\beta, \gamma = f(Ubias)$   $\mu_n \tau_n$ : up to 10<sup>-4</sup> cm<sup>2</sup>/V  $\mu_p \tau_p$ : 10<sup>-6</sup> cm<sup>2</sup>/V  $\tau_n$ : 50ns,

$$\tau_p$$
: 3ns.

$$\tau = \tau_0 \cdot \exp(\frac{\Delta E}{k \cdot T})$$

 $\Delta E \approx 0.2 eV$
