Compressed Ly- α likelihood

- Compressed Ly α [C. Pedersen, et al., arXiv: 2209.09895; DR14 Collab., arXiv: 1812.03554v3] :

$$\Delta_L^2 = 0.31 \pm 0.02, \quad n_L = -2.339 \pm 0.006$$

- ΛCDM is not steep enough/ over predicts LSS at high k : $\sim 5\sigma$ tension

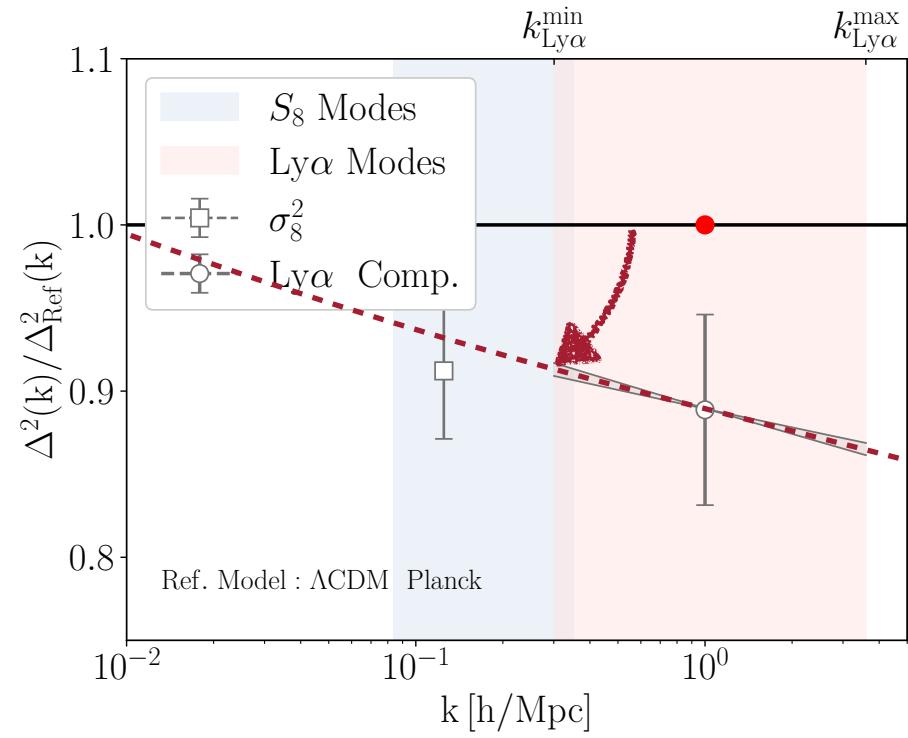

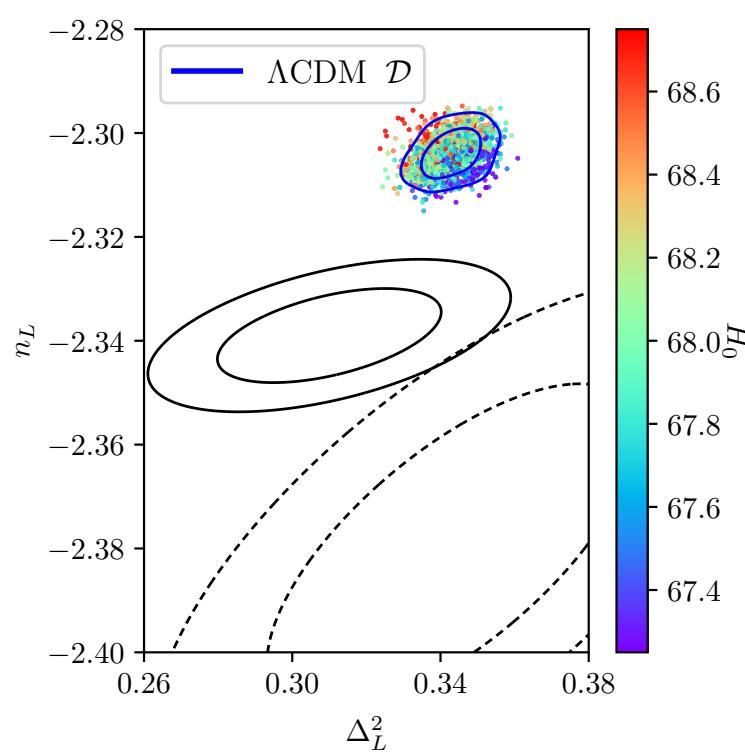

Compressed Ly- α likelihood

- Compressed Ly α [C. Pedersen, et al., arXiv: 2209.09895; DR14 Collab., arXiv: 1812.03554v3] :

$$\Delta_L^2 = 0.31 \pm 0.02, \quad n_L = -2.339 \pm 0.006$$

- ΛCDM is not steep enough/ over predicts LSS at high k : $\sim 5\sigma$ tension

New physics: **suppress MPS** at high $k \sim 0.125 h/\text{Mpc}$, **fix H_0 correlation**

The appeal of DR models

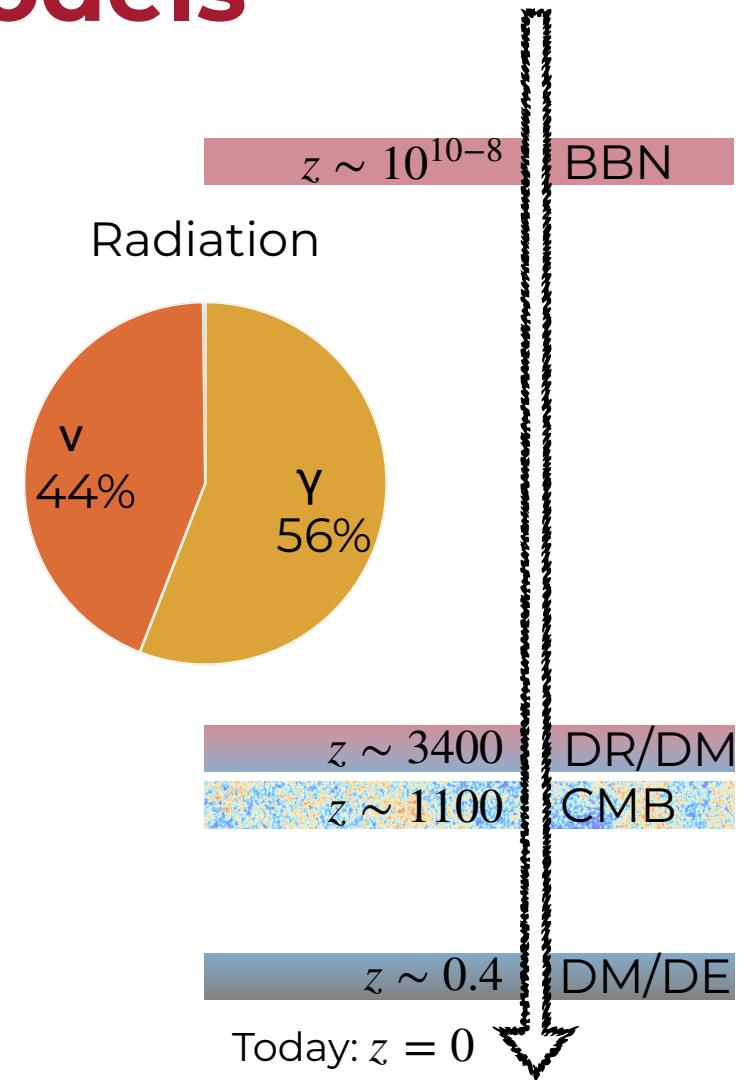

- Modify physics of CMB to resolve H_0 :

- Late time → Too many obs. (i.e. Pantheon)
- Early time → **Natural** to add **DR**

- Hubble - Sound Horizon relation:

$$\theta_s \sim r_s \times H_0$$

- DR \rightleftharpoons DM **suppresses** LSS at large k

The appeal of DR models

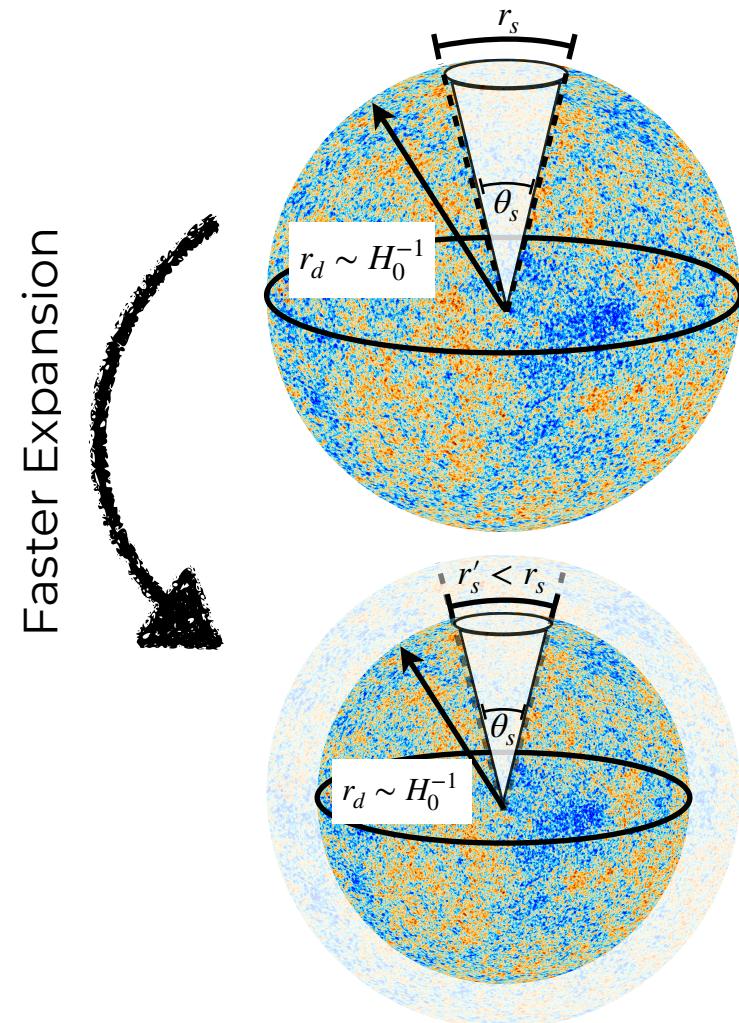

- Modify physics of CMB to resolve H_0 :

- Late time → Too many obs. (i.e. Pantheon)
- Early time → **Natural** to add **DR**

- Hubble - Sound Horizon relation:

73 km s^{-1} Mpc $^{-1}$

67.5 km s^{-1} Mpc $^{-1}$

- DR \rightleftharpoons DM **suppresses** LSS at large k

We can add **different types of DR**: What are their pros and cons?

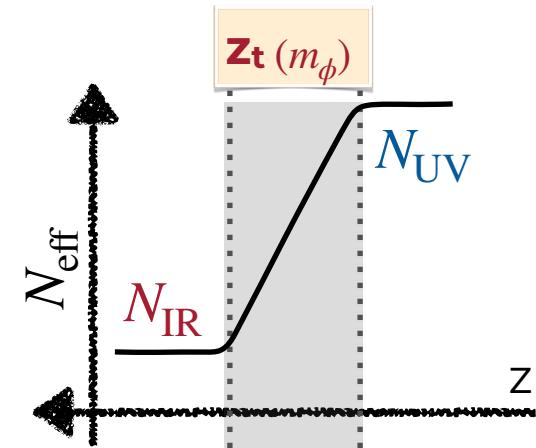

Different DR fluids: Pros & Cons

© [B. Wallisch, arXiv: 1810.02800]

© [M. Joseph, University of Utah]

Free-stream (N_{eff}):

- Silk damping
- Phase shift

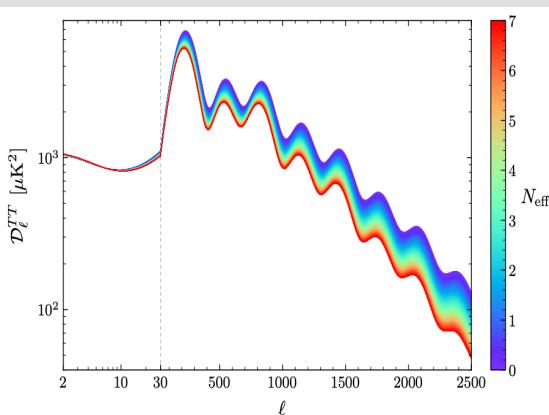

Self-interacting DR/ Perfect fluid (SIDR):

- Lower sound speed
(perfect fluid dyn.)
- Less phase shift

Stepped-fluid (WZDR):

- Perfect-fluid with massive component
- Control over z_t

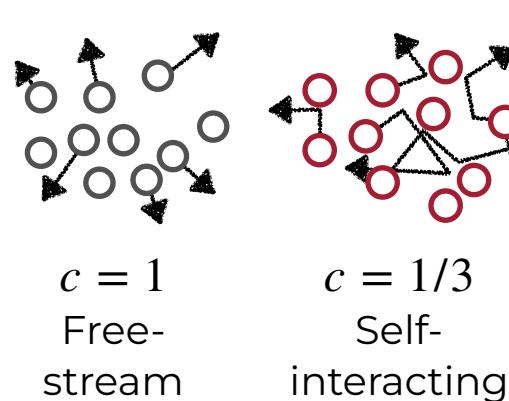

Different DR fluids: Pros & Cons

Coupled DR-DM: Fix for LSS tension

- Interaction with **DR** → **Transfers momentum** to **CDM** and gives

additional **pressure**: $\dot{\vec{P}}_\chi = -a\Gamma\vec{P}_\chi$

- Additional pressure → **Suppress structure formation**

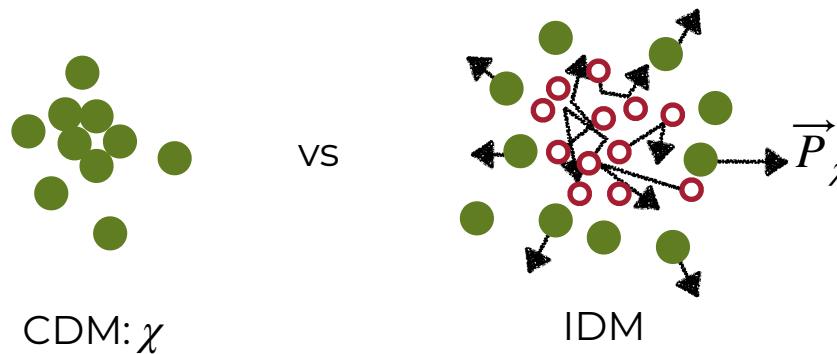

Coupled DR-DM: Fix for LSS tension

- Interaction with **DR** → **Transfers momentum** to **CDM** and gives

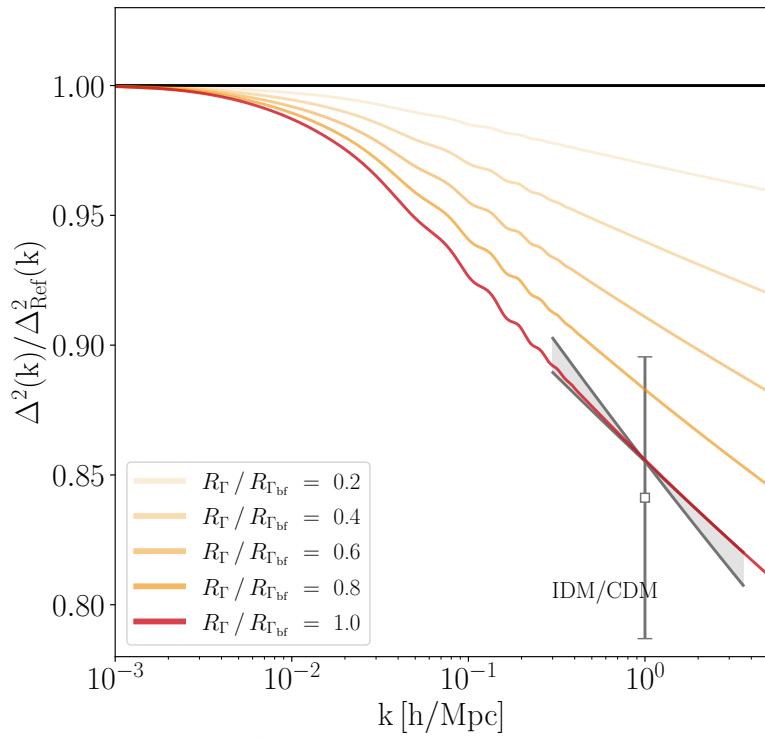

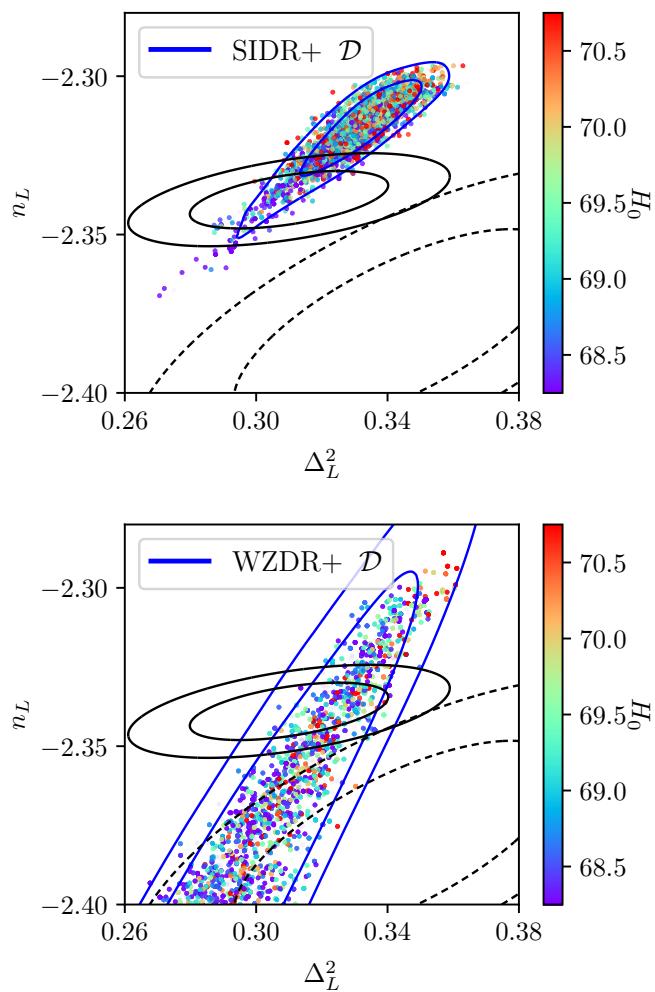

additional **pressure**: $\dot{\vec{P}}_\chi = -a\Gamma\vec{P}_\chi$

- Additional pressure → **Suppress structure formation**

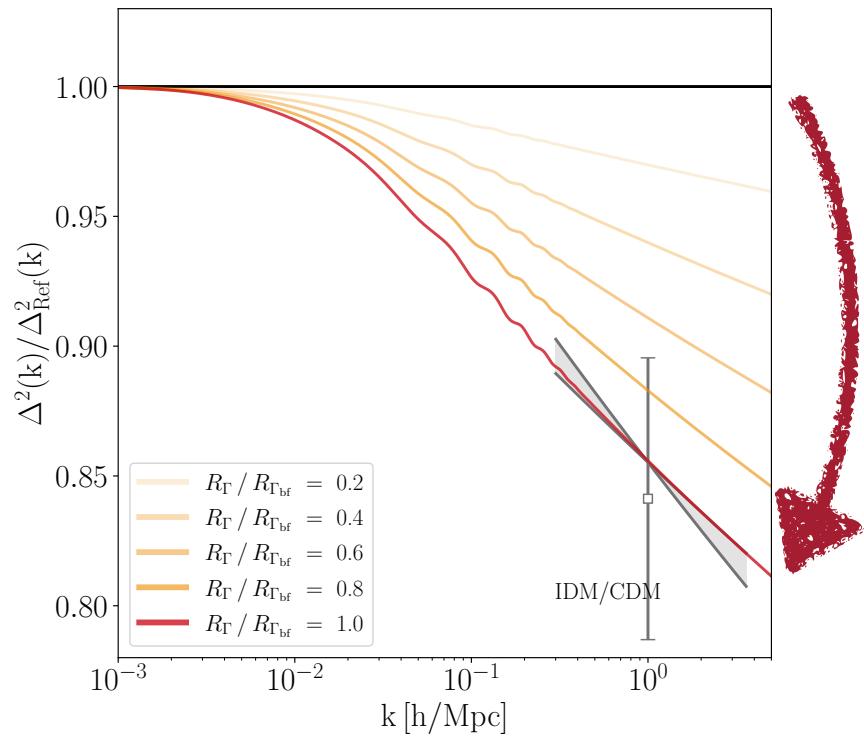

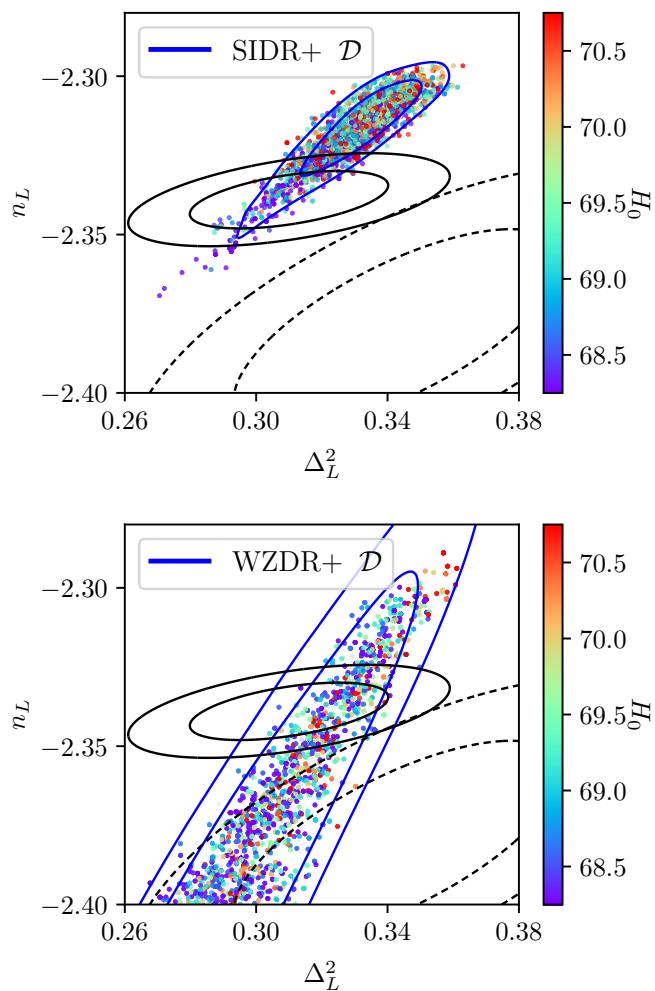

What will the **MPS** look like now?

DR interacting w DM: A drop in MPS

$$\frac{P_{\Gamma \neq 0}}{P_{\Gamma = 0}} \simeq \begin{cases} 1 & k \ll k_{\text{eq.}} \\ 1 - \frac{\Gamma}{H} \log \left(\frac{k}{k_{\text{eq.}}} \right) & k \gg k_{\text{eq.}} \end{cases}$$

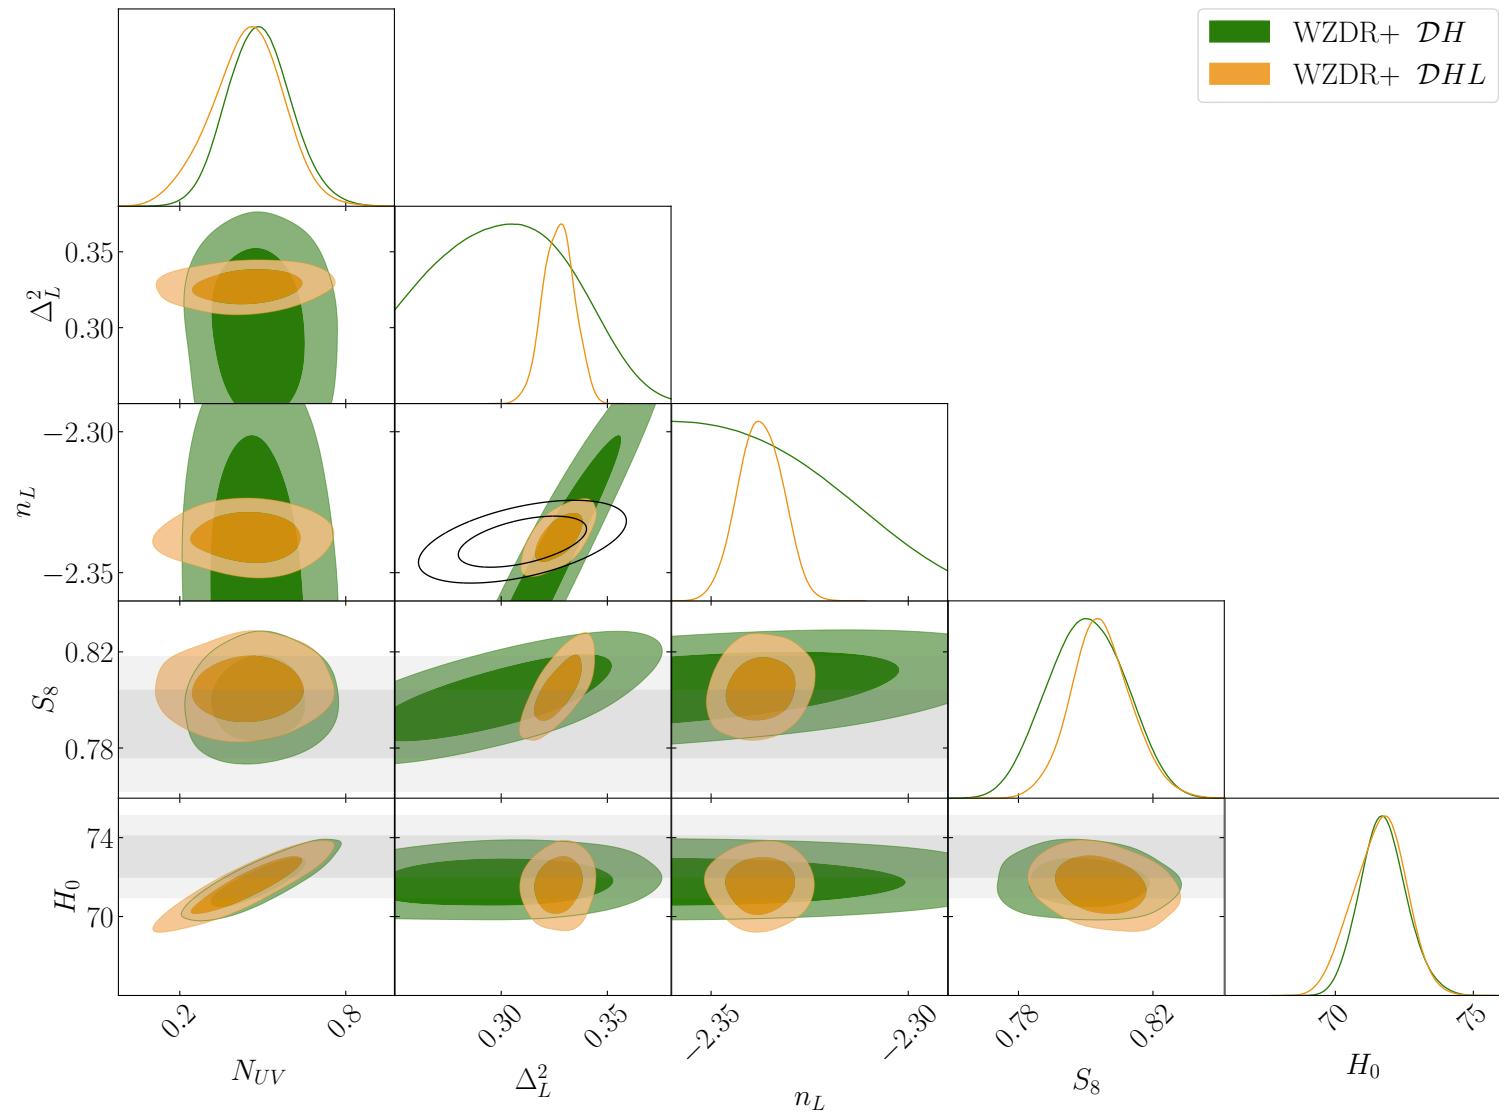

DR interacting w DM: A drop in MPS

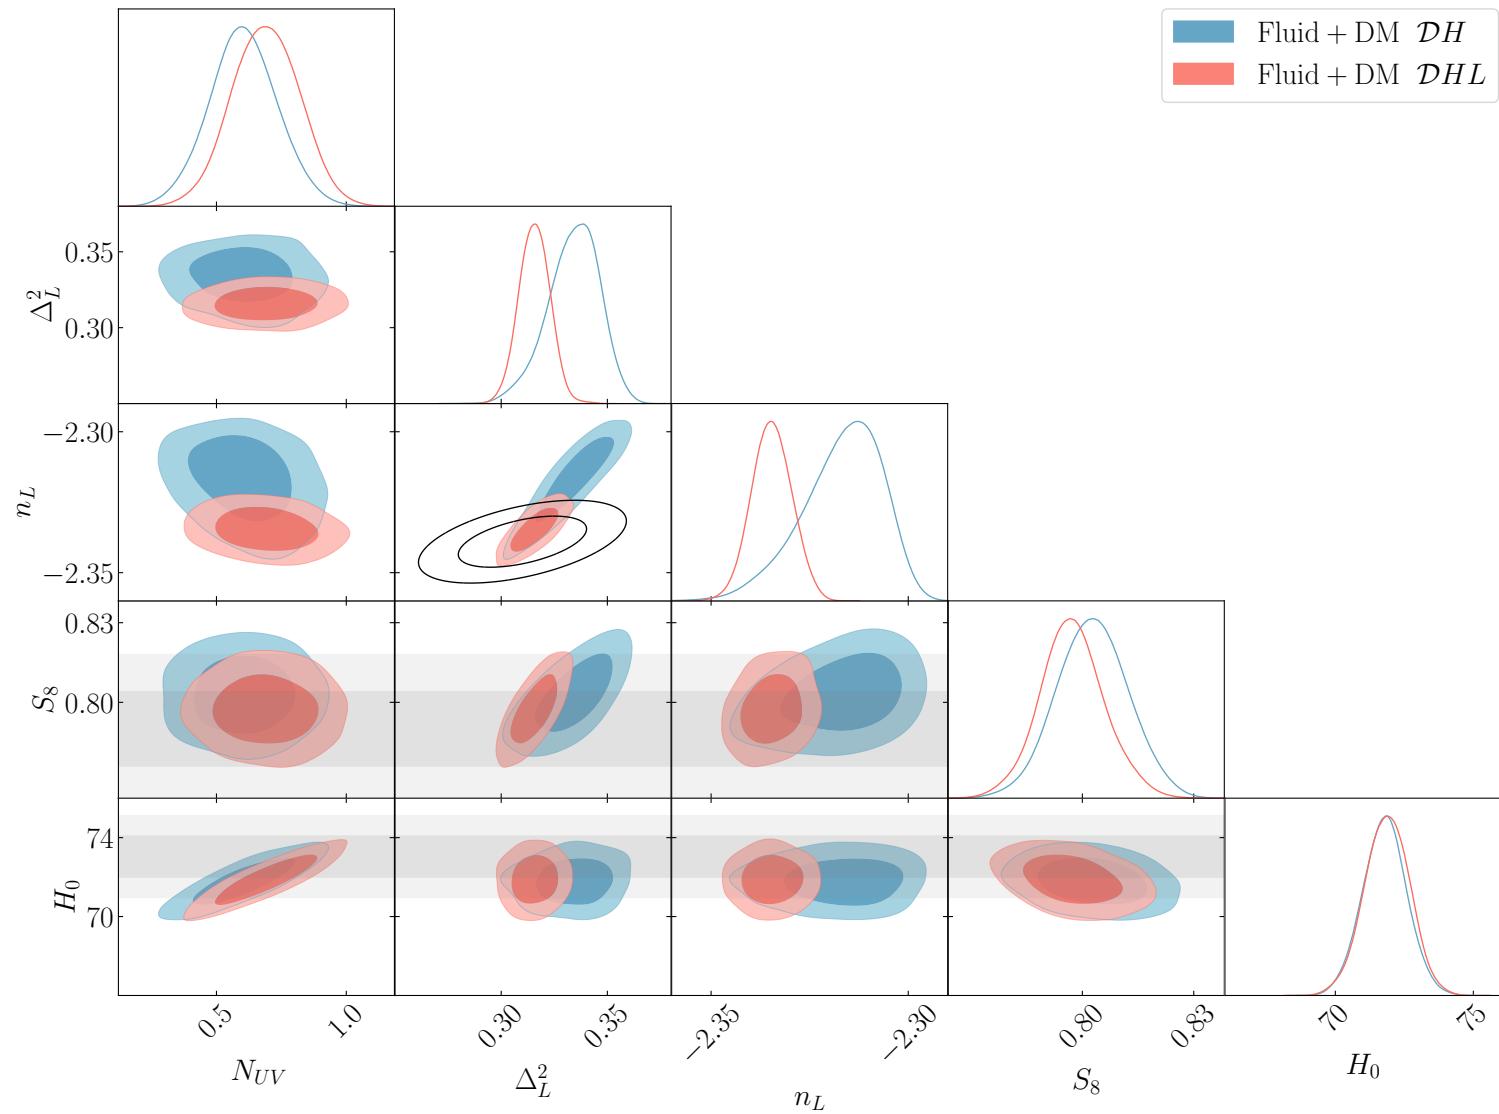

$$\frac{P_{\Gamma \neq 0}}{P_{\Gamma=0}} \approx \begin{cases} 1 & k \ll k_{\text{eq.}} \\ 1 - \frac{\Gamma}{H} \log \left(\frac{k}{k_{\text{eq.}}} \right) & k \gg k_{\text{eq.}} \end{cases}$$

Interaction controls the slope

WZDR + DM interactions: Full runs

SIDR + DM interactions: Full runs

DR fluid + DM interactions: Tensions

Model	H_0 Gaussian Tension	$\text{Ly-}\alpha$ Gaussian Tension
Λ CDM	$\sim 5.5 \sigma$	$\sim 4.9 \sigma$
SIDR + DM	$\sim 2.7 \sigma$	$\sim 1.3 \sigma$
Stepped Fluid + DM (WZDR+)	$\sim 2.6 \sigma$	0.6σ

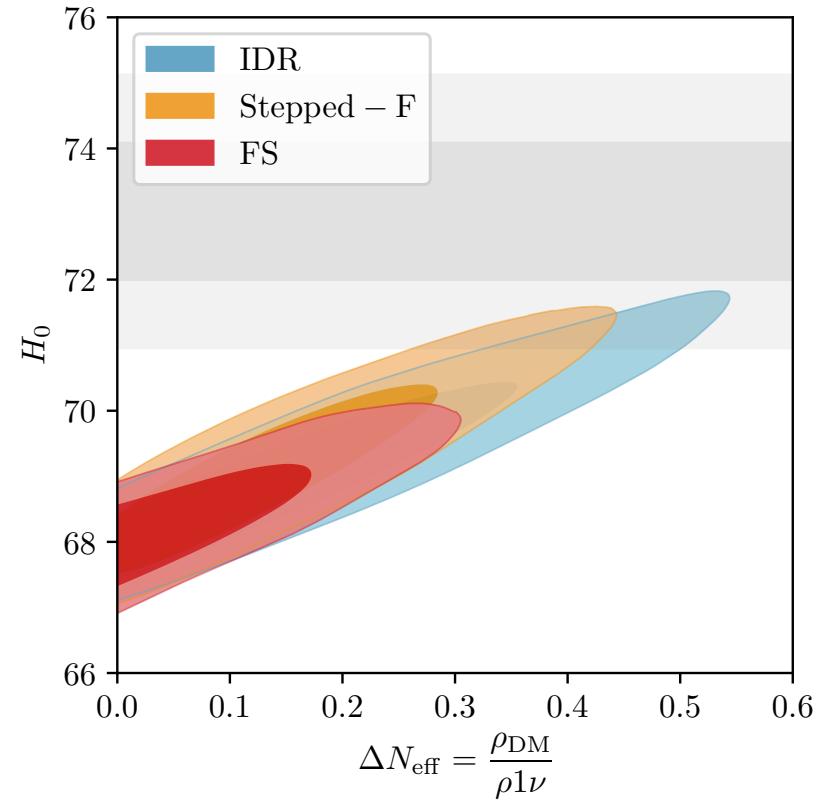

Summary

- ΛCDM is a **good model** of cosmology, but it **faces tensions** that might be pointing to **new physics**:
 - H_0 tension
 - LSS tensions (S_8 , Ly α , etc.)
- **Interacting DR** with **massive** components provide a natural solution to both tensions.
- **Future data** will be able to **further constrain** these models.

Thank you!

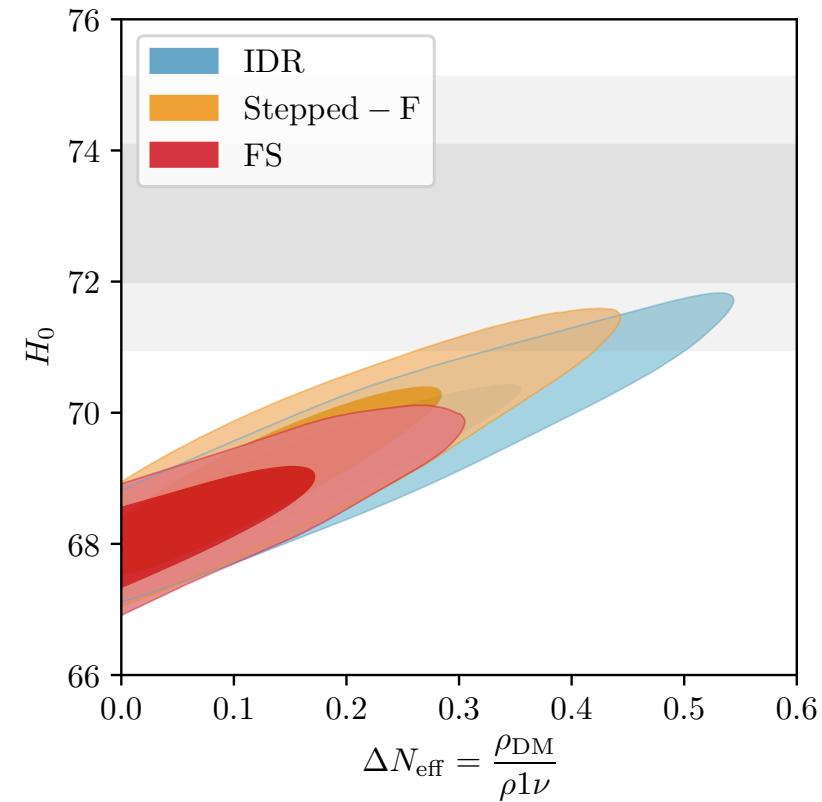

DR models: CMB/ SHOES results

Model	Gaussian Tension (H_0)
Λ CDM	$\sim 5.0 \sigma$
N_{eff}	$\sim 3.7 \sigma$
SIDR	$\sim 3.1 \sigma$
WZDR	$\sim 2.7 \sigma$

DR models: CMB/ SHOES results

Model	Gaussian Tension (H_0)
Λ CDM	$\sim 5.0 \sigma$
N_{eff}	$\sim 3.7 \sigma$
SIDR	$\sim 3.1 \sigma$
WZDR	$\sim 2.7 \sigma$

H_0 Olympics **gold medal** winner! [N. Schöneberg, et al., **arXiv**: 2107.10291]

Free-streaming DR fails to fix H_0

- **Simplest** implementation:

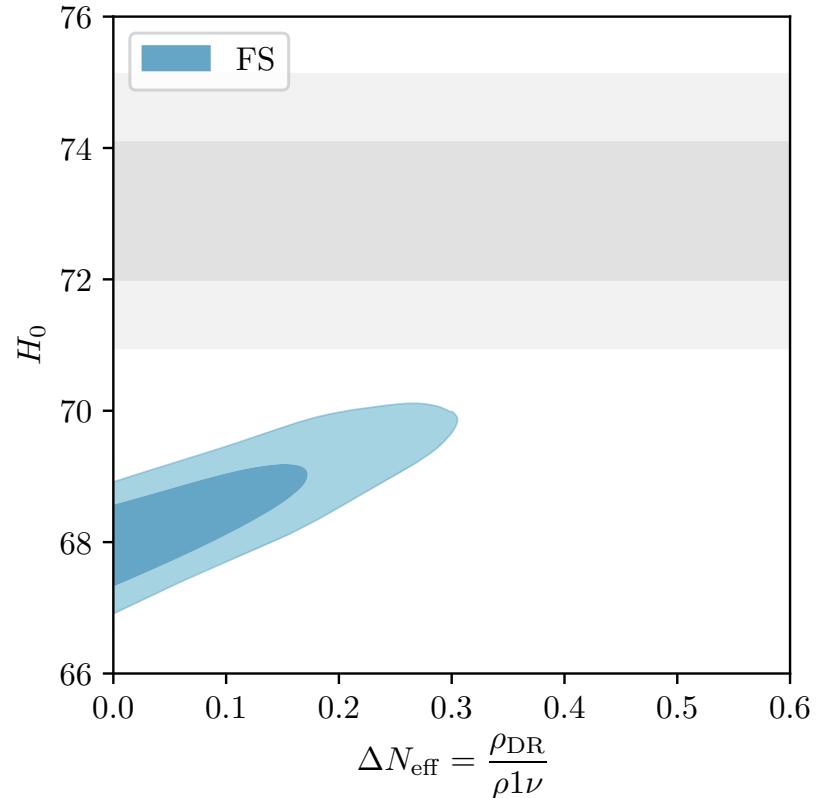

$\Lambda CDM + \Delta N_{\text{eff}}$ (free streaming)

- Free streaming (FS) **doesn't**

make it:

- Drop in CMB tail (silk damping)
- Phase shift in CMB high ℓ (neutrino drag)

- **CMB is unhappy** →
FS too constrained

Free-streaming DR fails to fix H_0

- **Simplest** implementation:

$$\Lambda CDM + \Delta N_{\text{eff}} \text{ (free streaming)}$$

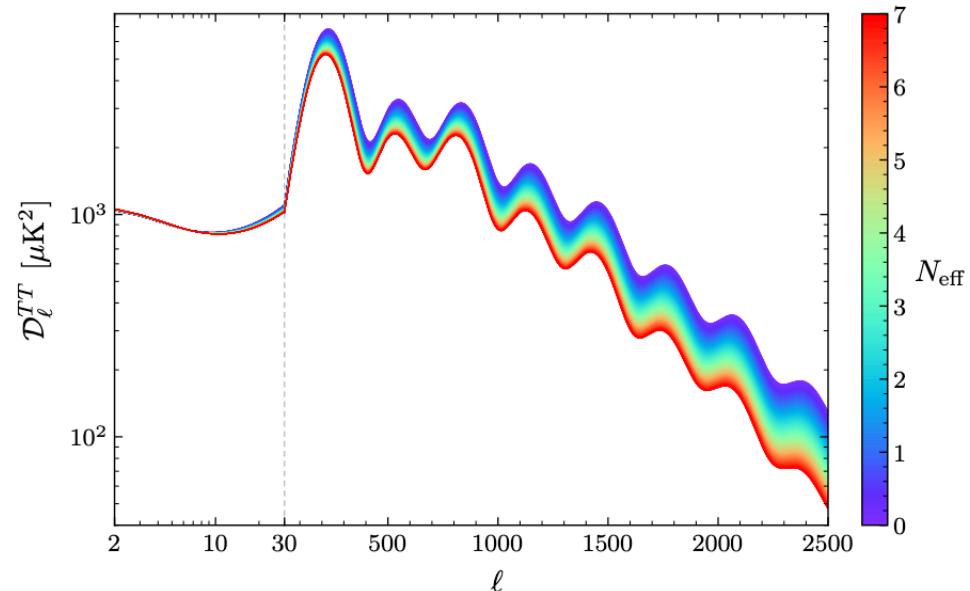

- Free streaming (FS) **doesn't**

make it:

- Drop in CMB tail (silk damping)
- Phase shift in CMB high ℓ (neutrino drag)

- **CMB is unhappy** →

FS too constrained

© [B. Wallisch, arXiv: 1810.02800]

It's the **right direction**, but how can we **minimize the effect** of **FS** on **CMB**?
Maybe use **interacting DR!**

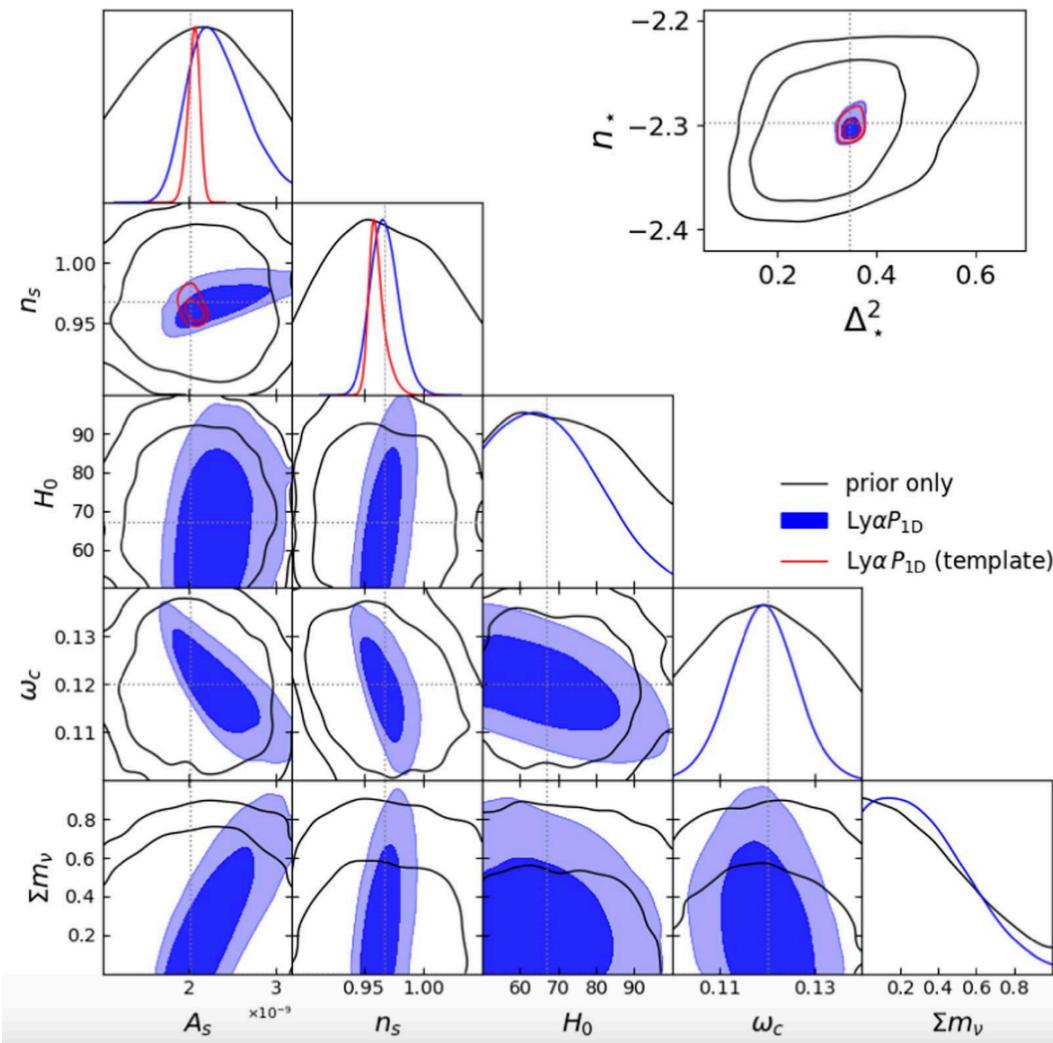

Model Summary

- Summary of model parameters:

SIDR + DM		WZDR + DM		
ΔN_{eff} or N_{UV}	Γ/H	ΔN_{eff} or N_{UV}	Γ/H	$z_t(m_\phi)$

- \mathcal{D} : **CMB** (Planck 2018 TT, EE, TTEE & Lensing),
Pantheon, **BAO**, **Full-shape** data from BOSS DR12,
S₈(combined DES-Y3 & KiDS-1000)
- H : **SHOES** measurement of H_0
- L : compressed likelihood on **slope** and **amplitude**
of MPS at $z = 3$ and $k = 0.009$ s/km
