# ***CONTEXT & STRATEGY***

# EURECA CDR (2014)

- *European Underground Rare Event Calorimeter Array*: Federation of European efforts for direct DM Search with cryogenic experiments
- Conceptual Design Report [Phys. Dark Univ. 3 (2014) 41]
- Goal:  $2 \times 10^{-47}$  pb @ 50 GeV (cMSSM inspired WIMPs)
- Common cryostat for 1-ton size experiment
- $< 1$  evt/keV/ton/y background
- Variety of target: Ge +  $\text{CaWO}_4$
- Site: LSM (Fréjus tunnel)

~~extension in 2017~~

# Change of scene since 2014 CDR

- LSM extension delays
- No signs of cMSSM SUSY @LHC: need to widen the search
- Rapid progress of xenon at high mass
- Identification of “Low-WIMP mass” region above the Solar  $\nu$  floor, ideally suited for low-threshold cryogenic detectors

*New EURECA strategy targeted at low mass & challenges associated with low thresholds*

# Choice of hunting ground

J. Billard et al., PRD 89 (2014)

# The GeV region

J. Billard et al., PRD 89 (2014)

# The $^8\text{B}$ region

*J. Billard et al., PRD 89 (2014)*

# Updated EURECA strategy

- Aim: 1-20 GeV mass range, ideally suited for cryogenic detectors
- First step: tune the  $\text{CaWO}_4$  and Ge detectors to fully exploit the full potential for cryogenic detectors for low thresholds
- Exploit current facilities at LSM and LNGS (with few kg) until external radioactive bkg's require major upgrades
- Larger exposure ( $>1000$  kg.day):  
prepare detector adaptation to very-low background SuperCDMS @ SNOLAB environment currently being designed
  - *Preparation made possible by openness of SuperCDMS to share design info & MC code with EURECA*

---

# ***CRESST DETECTOR CHALLENGES AND PLANS***

# CRESST Collaboration

# CRESST-II detectors

## *Cryogenic Rare Event Search with Superconducting Thermometers*

**Scintillating  $\text{CaWO}_4$  crystals as target**

Target crystals operated as **cryogenic calorimeters** ( $\sim 15\text{mK}$ )

Separate **cryogenic light detector** to detect the scintillation light signal

### **Energy deposition:**

- mainly phonons  
(almost independent of the type of particle)

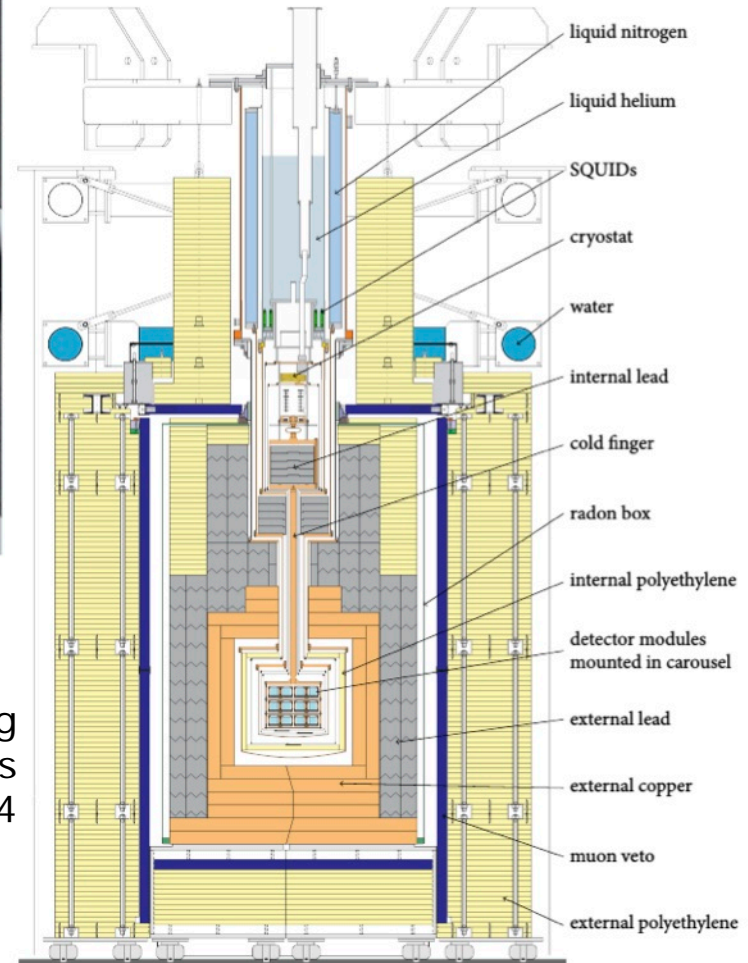

### **Measurement of deposited energy**

- small fraction into scintillation light  
(characteristic of the type of particle)

### **Particle discrimination**

**Two simultaneous signals from the two transition edge sensors (TES)**

# CRESST Experimental setup

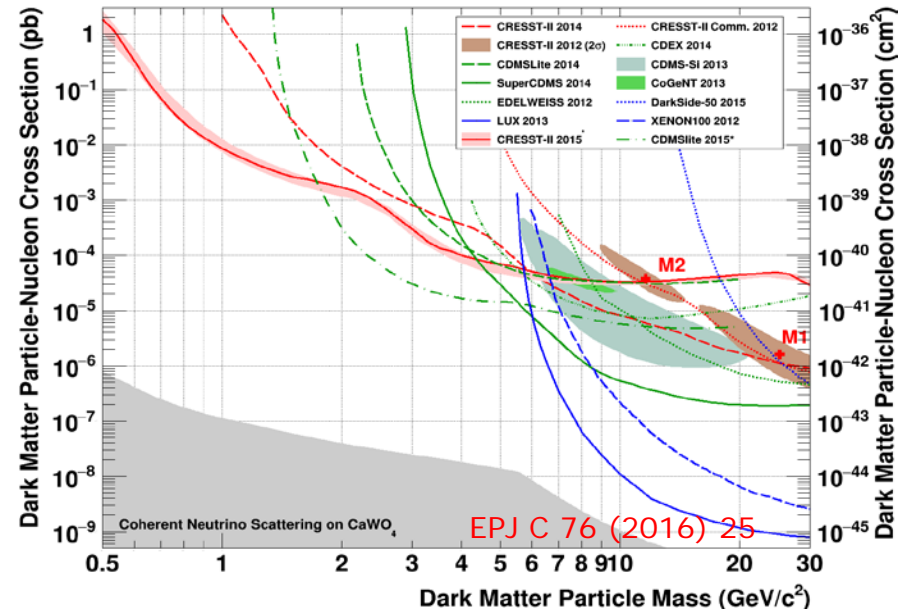

18 300g  
detectors  
in 2014

SQUID  
Readout

# CRESST-II Results

- Based on 300g crystal with best nuclear recoil threshold (307 eV)
- World-leading result for masses below  $1.7 \text{ GeV}/c^2$
- First experiment to explore masses in the sub- $\text{GeV}/c^2$  range
- Exploit different sensitivities of O, Ca and W recoils

# CRESST-III detectors

*Change of strategy to improve sensitivity to low masses*

Detector design optimization:

- Clean self-grown crystals
- Small crystals (20x20x10)mm<sup>3</sup> (**25g**)
- 100 eV threshold design goal
- Small light detector (20x20)mm<sup>2</sup>
- 6 modules with < **100 eV** threshold running at LNGS

# CRESST-III preparation

Construction kit for a CRESST-III module

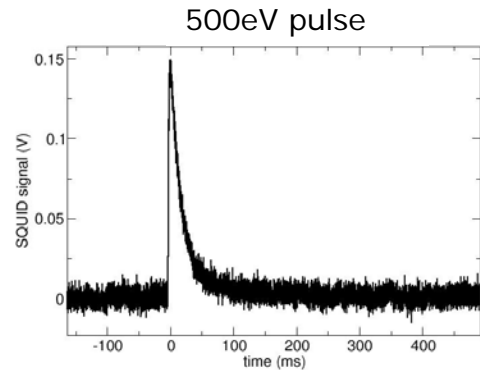

CRESST-III modules during assembly

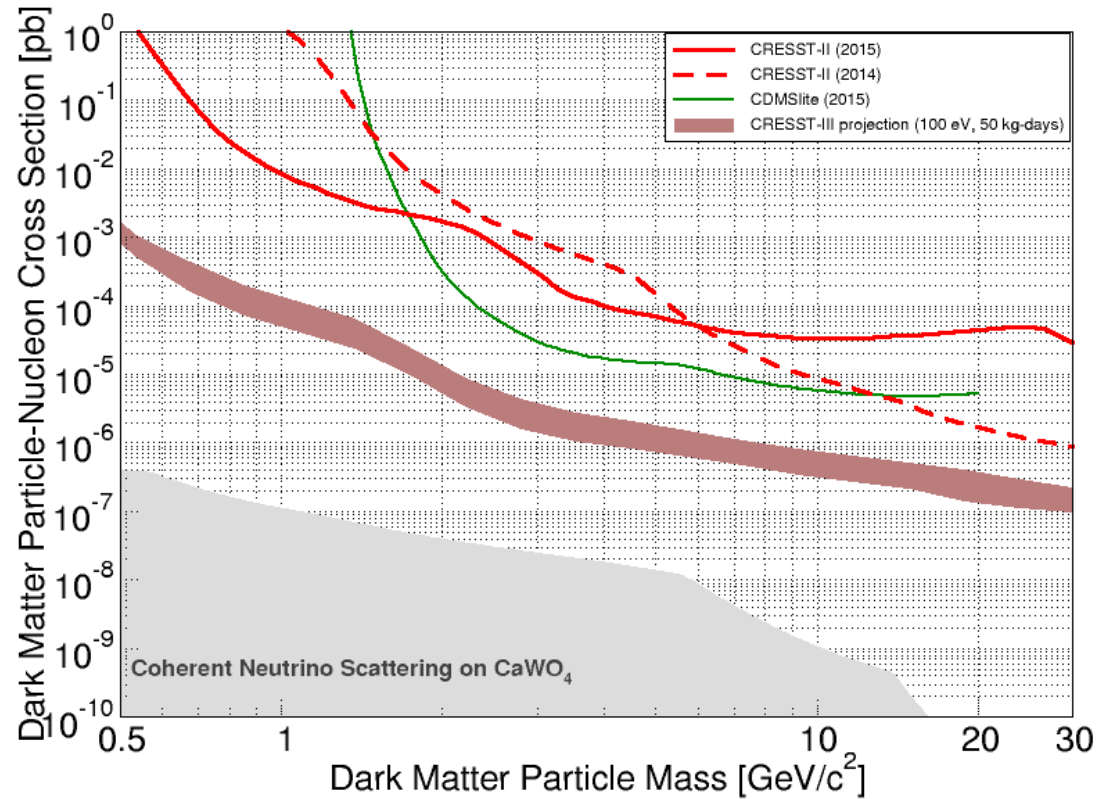

CRESST-III modules installed in the LNGS facility.  
Data taking since summer 2016

# CRESST-III phase I goals

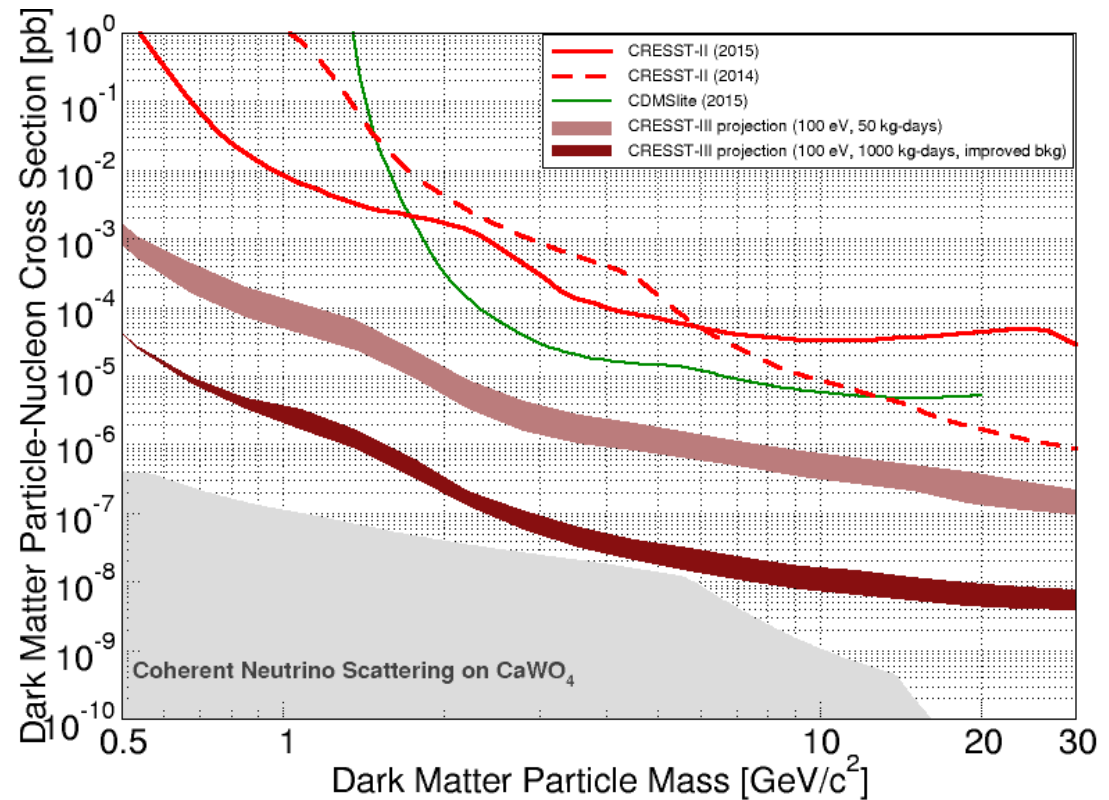

Projected sensitivity  
for 50kg days (1 year)  
with design goal  
threshold (100eV)

# CRESST-III phase II

- Material screening and purification of raw material for crystal production
  - Factor 100 reduction of background
- Upgrade of LNGS facility to operate 100 detectors
  - 1000 kg days in 2 years

 Univ. SHEFFIELD

- Direct detection of WIMPs, germanium target
- 20 kg Ge total (largest for DM search), 870g units
- Ionization + Heat
  - Position independent ( $\sim$ thermal) heat measurement *PLB 681 (2009) 305*
  - Emphasis on complete  $e^- + h^+$  charge readout *JINST 11 (2016) 10008*
- Simple & robust design
  - Important for scalability to large arrays
  - Initially designed for  $>20$  GeV WIMP search, extended down to 5 GeV given achieved resolutions *EPJC 76 (2016) 548*
- Laboratoire Souterrain de Modane
  - Deepest in Europe :  $5 \mu/m^2/day$

# Fully InterDigitized electrode design

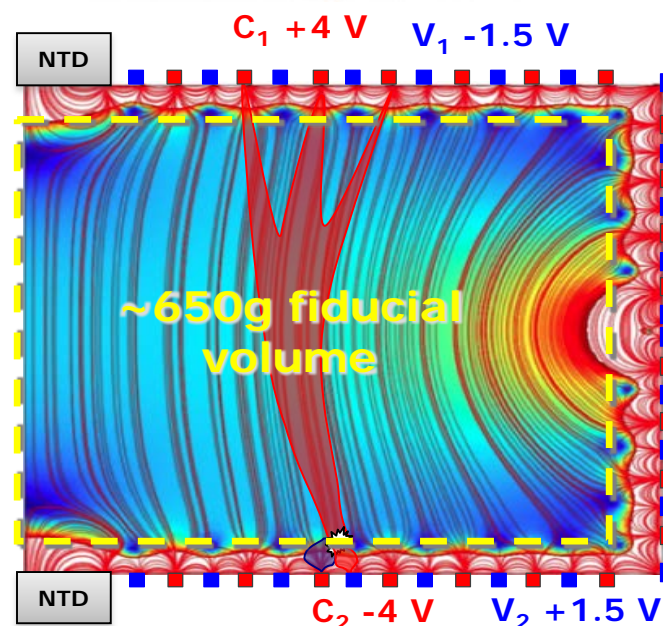

- ~870g detectors ( $\phi=70$  h=40 mm)
- 2 GeNTDs heat sensor per detector
- Electrodes: concentric Al rings (2 mm spacing) covering all faces
- XeF<sub>2</sub> surface treatment to ensure low leakage current (<1 fA) between adjacent electrodes

*J Low Temp Phys (2014) 176: 182-187*

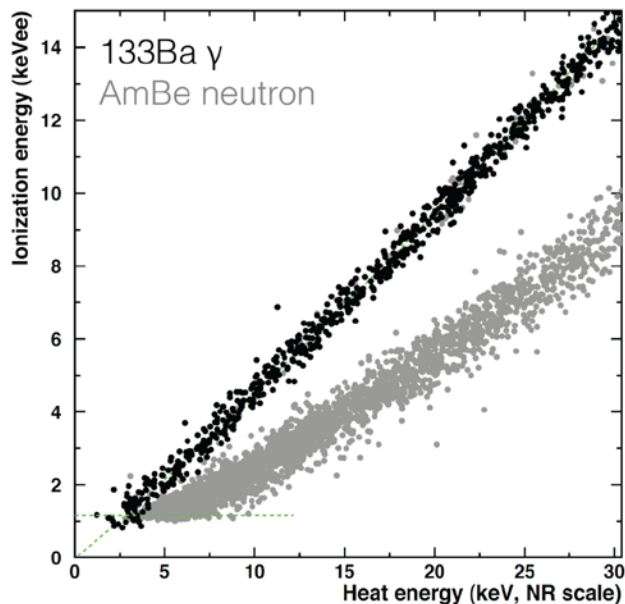

## Surface event rejection

*Phys Lett B 681 (2009) 305-309*

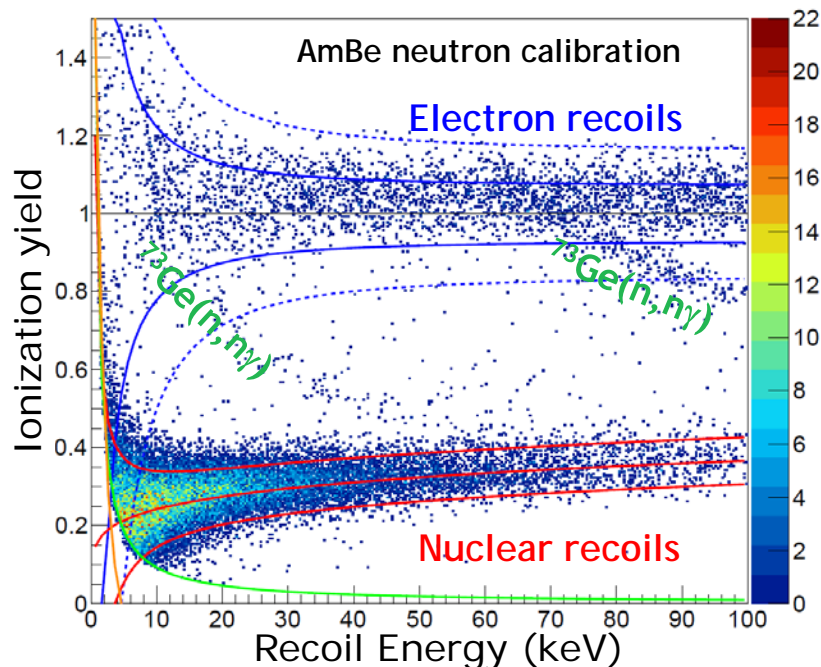

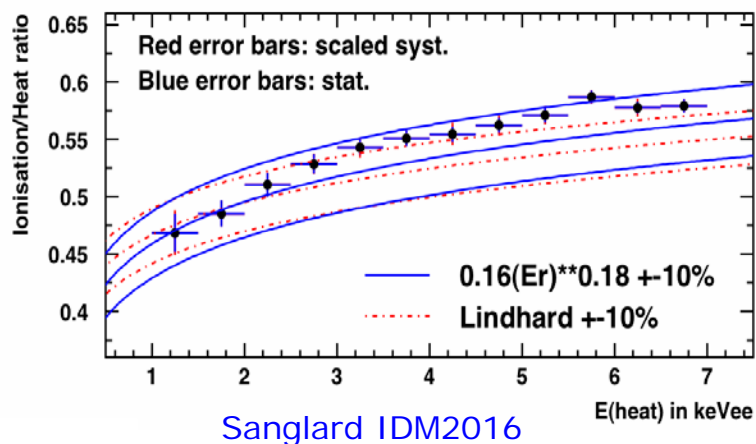

- Bulk event: charges collected by C<sub>1</sub> and C<sub>2</sub> ; V<sub>1</sub> and V<sub>2</sub> act as veto
- Surface events: charges collected by either C<sub>1</sub>V<sub>1</sub> or C<sub>2</sub>V<sub>2</sub>

# Nuclear recoil calibration + discrimination

- Clear event-by-event separation down to 5 keV energy recoils
- Response to nuclear recoils calibrated down to the analysis threshold for low-mass WIMP searches  
( $1 \text{ keV}_{ee} \text{ heat} = 2.5 \text{ keV nuclear recoil}$ )

# Gamma rejection

&

# Surface rejection

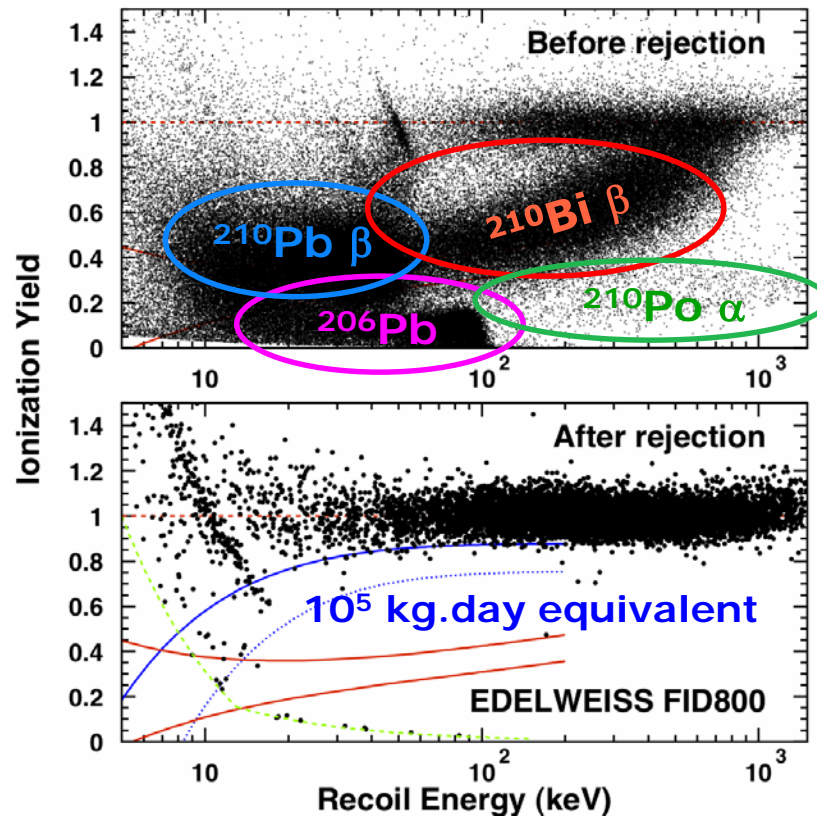

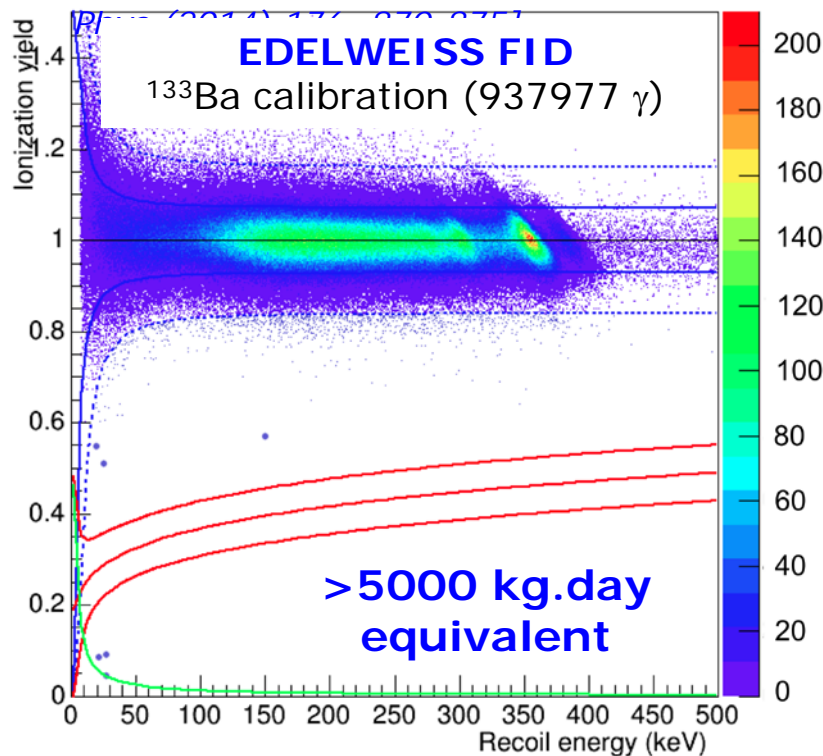

- $\gamma$  rejection factor:  $< 5.6 \times 10^{-6}$

[J Low Temp Phys (2012) 167: 1056-1062]

Updated now to  $< 2.5 \times 10^{-6}$  with additional detectors + statistics

- Surface evts rejection ( $^{210}\text{Pb} + ^{210}\text{Bi}$   $\beta$ ,  $^{210}\text{Po}$   $\alpha$ ,  $^{206}\text{Pb}$  recoils):  $< 4 \times 10^{-5}$

[J Low Temp

# EDELWEISS-III 2014-2015 data taking

- 161 days of physics data with 24 FIDs: >3000 kgd total

- Low electron-recoil bkg: 19 FIDs used in first measurement of cosmogenic production of  $^3\text{H}$  in Ge [[arxiv:1607.04560](https://arxiv.org/abs/1607.04560)]

- 8 lowest threshold FIDs used for low-mass WIMP search

# Low-Mass analysis

- Analysis with Boosted Decision Tree [JCAP05 (2016) 019]
- Analysis with Profile Likelihood [EPJC 76 (2016) 548]

- Improvement by x20 to x150 between 7 and 10 GeV wrt EDELWEISS-II
- Limited by heat-only background: *identification and rejection using the  $\sigma=230$  eV resolution on ionization*
- Ionization resolution is key for rejection
- Heat resolution is key for low thresholds

# Strategy for low-mass WIMP searches

---

- 1. High Voltage: Amplify heat signal to reduce threshold**
  - $8\text{ V} \rightarrow 100\text{ V}$
- 2. Lower the intrinsic heat threshold**
  - *Improved heat sensors*
  - $500\text{ eV (RMS)} \rightarrow 100\text{ eV (RMS)}$
- 3. Reduce background from heat-only events**
  - */100 heat only rate*
- 4. Extend background ID to lower energy**
  - *Improved ionization measurement*
  - $200\text{ eV (RMS)} \rightarrow 100/50\text{ eV (RMS)}$

# Challenge #1: High-voltage

Heat thresholds improved using larger bias voltages

$$E_{TOTAL} = E_{RECOIL} + E_{ION} \frac{\Delta V}{3 Volt}$$

- Heat signal boosted by Neganov-Luke effect ( $\sim$ Joule heating, factor  $[1 + V_{bias}/3]$ )
- Loss of ionization-based bkg discrimination: method benefits low-mass searches only

100V bias already achieved

# Challenge #2: heat sensor resolution

JLTP 184 (2016) 299

Ba events: FID 837 @ 18 mK - MCMC3

- Better understanding of heat signal
  - Thermal modeling of signal, verified with dedicated R&D
  - Identification of sensitivity to ballistic phonons
  - Identification of parasitic heat capacity
- Sensitivity of 200 nV/keV (x6 wrt present FIDs) achieved on 250 g test detectors

## Challenge #3: heat-only events

- Dominant (+reproducible) background at low energy
- Noise, cryogenics, stress from detector suspension: excluded as sources of this background
- Remaining suspect: stress from glueing, avoided via:
  - *Two “deported NTD”, glued on separate sapphire wafer*
  - *Photo-lithographed high- $\Omega$  NbSi TES, sensitive to athermal phonons*
- Following promising tests, present cool-down @ LSM of 5 detectors with these new designs

# GeV-range prospects with goals 1+2(+3)

# Future: reduce backgrounds, increase mass

- EDELWEISS sensitivity for 35 ton.day = 100 kg x 1 year [ J Low Temp Phys 184 (2016) 308 ]
- Suppression of Heat-Only becomes essential in GeV range
- In 5-20 GeV range, need:
  - Improve ionization resolution (for discrimination) from  $\sigma=230$  to 100 eV
  - reduction of neutron + bulk electron recoils reduction by /10 wrt present setup

→ achievable in future in SuperCDMS environment planned @SNOLAB

- Study implication of SuperCDMS tower design +HEMT readout on EDELWEISS detectors
- Collaboration on CUTE test facility @SNOLAB
- Study improvement of charge readout with HEMTs

# Goal 4: ionization resolution

- **Transitioning from JFET to HEMT**
  - Lower intrinsic noise, low heat load
  - Works at 4K: shorter cables reduces capacitance and improves resolution
  - Considered by EDW/HARD (resolution) [XB+AB NIMA 787 (2015) 51] and SuperCDMS (heat load) [AP, JLTP 176 (2014) 466 and 911]
- **Successful HEMT amplifier with sub-100 eV<sub>RMS</sub> ion. resolution**  
[A. Phipps, arXiv:1611.09712, collaboration between SuperCDMS and EDW]
- Step#1: Upgrade EDW ionization readout with this new design
- Step#2: Electrode design to reduce detector capacitance to reach 50 eV<sub>RMS</sub>
- **Increase of electrode spacing from 2 to 4 mm already successfully implemented**

A. Phipps et al, arXiv: 1611.09712

**FID842**  
**2 mm spacing**

**FID824**  
**4 mm spacing**

# Entering the $^8\text{B}$ region

- Projection with  $\sigma=100$  eV ion. resolution, 100 kg x 1 year

# $^8\text{B}$ region exploration with FID+HEMT

- Separation of  $^8\text{B}$  CNS signal ( $\sim 6$  GeV WIMP, black) with  $\sigma_{\text{ion}} = 50$  eV (wrt present  $\sim 200$  eV)
- E resolution:  $\sim 10\%$  @  $1 \text{ keV}_{\text{ee}}$   
*spectral separation for WIMP searches close to 6 GeV*
- Simulated BDT analysis:  
*78 "bkg-free"  $^8\text{B}$  events in 1 t.y*  
(8 in 100 kg x 1 year)
- Paving the way for a detailed measurement of this important (and yet to be observed) background from  $^8\text{B} \nu$  CNS

# Conclusions

---

- The European collaboration for cryogenic crystal detectors (EURECA) has updated its objectives relative to its 2014 CDR
- *Emphasis for 1-20 GeV WIMP masses*, for which the detector technology is ideally suited (low threshold on heat signal)
- 2017-2018 prospects in the GeV-WIMP range:  $10^{-41} \text{ cm}^2$  @1.5 GeV with both CRESST and EDELWEIS, achievable in present facilities @ LSM and LNGS
  - Factor 10 improvement in a future 1000 kgd CRESST-III phase-II
- Larger exposure with lower external background: collaboration with SuperCDMS@SNOLAB
  - Adaptation to SuperCDMS tower design under study
- *Prospects for WIMPs in the  $^8\text{B}$  region*
  - ~100 kg low-capacitance FIDs+HEMTs at SNOLAB to complement nicely the SuperCDMS-SNOLAB reach with clear “bkg-free”  $^8\text{B}$  CNS signal

- Calculated assuming present EDELWEISS background (including Heat-only)

Arnaud, LTD2015

# $^8\text{B}$ region with xenon

## LZ WIMP Signal Region Example - We must also understand $^8\text{B}$ signal

- Xenon experiments may reach  $^8\text{B}$  floor in coming years
  - Very small efficiency limited by photon collection
  - $^8\text{B}$  backgrounds difficult to control: very little spectral response

Measurement WITH good energy resolution and background rejection is needed to properly control this background
