

Beyond 3 quark generations

Jennet Dickinson

290e – February 27, 2019

Introduction

Three generations of matter (fermions)

	I	II	III		
mass →	2.4 MeV/c ²	1.27 GeV/c ²	171.2 GeV/c ²	0	? GeV/c ²
charge →	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$	0	0
spin →	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	0
name →	u up	c charm	t top	γ photon	H Higgs boson
	d down	s strange	b bottom	g gluon	
Quarks					
	<2.2 eV/c ²	<0.17 MeV/c ²	<15.5 MeV/c ²	91.2 GeV/c ²	
	0	0	0	0	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	Z⁰ Z boson	
	0.511 MeV/c ²	105.7 MeV/c ²	1.777 GeV/c ²	80.4 GeV/c ²	
	-1	-1	-1	± 1	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
Leptons	e electron	μ muon	τ tau	W[±] W boson	Gauge bosons

- In the Standard Model, have 3 generations of quarks
 - Spin $\frac{1}{2}$
 - Electric charge $+\frac{2}{3}$ or $-\frac{1}{3}$
 - Color triplets
 - L-handed weak isospin doublet + R-handed singlet

The simplest extension

Three generations of matter (fermions)

	I	II	III		
mass →	2.4 MeV/c ²	1.27 GeV/c ²	171.2 GeV/c ²	0	7 GeV/c ²
charge →	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$	0	0
spin →	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	0
name →	u up	c charm	t top	γ photon	H Higgs boson
	4.8 MeV/c ²	104 MeV/c ²	4.2 GeV/c ²	0	
	$-\frac{1}{3}$	$-\frac{1}{3}$	$-\frac{1}{3}$	0	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
Quarks	d down	s strange	b bottom	g gluon	
	<2.2 eV/c ²	<0.17 MeV/c ²	<15.5 MeV/c ²	91.2 GeV/c ²	
	0	0	0	0	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	Z⁰ Z boson	
	0.511 MeV/c ²	105.7 MeV/c ²	1.777 GeV/c ²	80.4 GeV/c ²	
	-1	-1	-1	±1	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
Leptons	e electron	μ muon	τ tau	W[±] W boson	

- Add a pair of quarks that *interact just like the others*
- Since we haven't seen them yet, they must have *high mass*

Implications of heavy quarks

- Heavy quarks b'/t' can be directly produced at high enough \sqrt{s}
 - 😊 Possibility for direct searches at colliders
- Everywhere we sum over quarks, we now have extra terms for b' and t' that we know how to calculate
 - 😊 Can derive indirect constraints if masses are too high for direct detection

Implications of heavy quarks

- Mixing between b'/t' and known quarks
 - 😊 Decays to known quarks tell us what final states to search for
 - 😊 Possible new source of CP violation
 - 😞 Could create issues with CKM matrix unitarity
(I'm going to ignore this)

Direct searches

- A quick search of ATLAS and CMS results on 4th generation quarks gives:
 - [ATLAS search](#) at 7 TeV for 4th generation d-type quarks
 - [ATLAS search](#) at 7 TeV for pair production of a new quark decaying to Z+b
 - [ATLAS search](#) at 7 TeV for 4th generation d-type quarks decaying to 1 lepton + hadronically decaying W
 - [CMS search](#) at 7 TeV for 4th generation u-type quarks with a lepton in the final state

Direct searches

- A quick search of ATLAS and CMS results on 4th generation quarks gives:
 - [ATLAS search](#) at **7 TeV** for 4th generation d-type quarks
 - [ATLAS search](#) at **7 TeV** for pair production of a new quark decaying to Z+b
 - [ATLAS search](#) at **7 TeV** for 4th generation d-type quarks decaying to 1 lepton + hadronically decaying W
 - [CMS search](#) at **7 TeV** for 4th generation u-type quarks with photon in the final state

Haven't we made progress on this since Run 1?

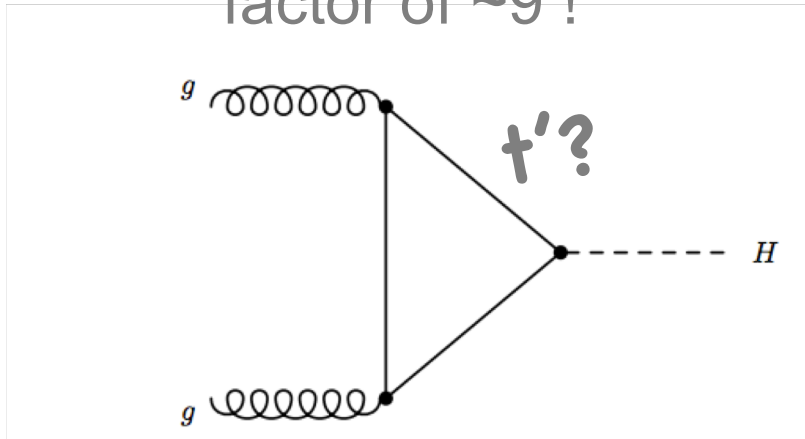

Indirect constraints

- Everywhere we sum over quarks, we now have extra terms for b' and t'
- Example: cross section of Higgs production via gluon-gluon fusion (ggF)
 - Presence of b'/t' increases this cross section by a factor of ~ 9 !

Indirect constraints

- Everywhere we sum over quarks, we now have extra terms for b' and t'
- Example: cross section of Higgs production via gluon-gluon fusion (ggF)
 - Presence of b'/t' increases this cross section by a factor of ~ 9 !

Higgs measurements strongly disfavor this

Adjusting the model

Three generations of matter (fermions)

	I	II	III		
mass →	2.4 MeV/c ²	1.27 GeV/c ²	171.2 GeV/c ²	0	7 GeV/c ²
charge →	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$	0	0
spin →	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	0
name →	u up	c charm	t top	γ photon	H Higgs boson
Quarks	4.8 MeV/c ²	104 MeV/c ²	4.2 GeV/c ²	0	
	$-\frac{1}{3}$	$-\frac{1}{3}$	$-\frac{1}{3}$	0	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
	d down	s strange	b bottom	g gluon	
Leptons	<2.2 eV/c ²	<0.17 MeV/c ²	<15.5 MeV/c ²	91.2 GeV/c ²	
	0	0	0	0	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	Z⁰ Z boson	
	0.511 MeV/c ²	105.7 MeV/c ²	1.777 GeV/c ²	80.4 GeV/c ²	
	-1	-1	-1	±1	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	
	e electron	μ muon	τ tau	W[±] W boson	

Gauge bosons

- How to introduce 4th generation quarks in a way that is compatible with experiments?
- Solution: alter the form of the Higgs-quark couplings for 4th generation

Quark couplings to Higgs

- For fermions, can generate mass and Higgs coupling terms with a Yukawa term:

$$\mathcal{L}_{\text{Yukawa}}(\phi, \psi) = -g\bar{\psi}\phi\psi$$

- ttH and H(bb) observations indicate that this describes Higgs coupling to t, b
- This form is convenient, but ***not required*** by the Higgs mechanism

Vector-like quarks (VLQ)

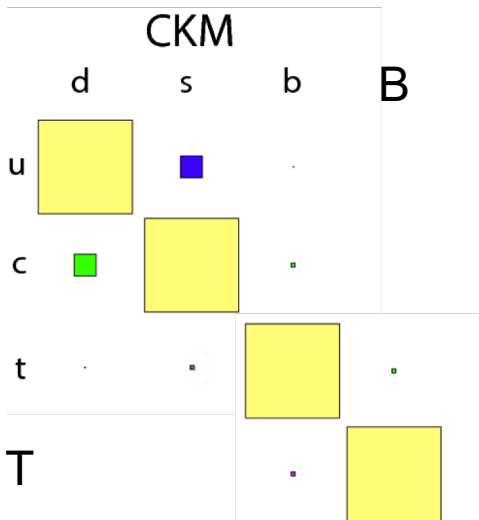

- They are quarks: spin $\frac{1}{2}$, electric charge $+\frac{2}{3}$ or $-\frac{1}{3}$, color triplets
- They are vector-like: R- and L-handed have the same EW quantum numbers
 - Mass and Higgs coupling terms cannot have the same structure as known quarks
 - EW singlets, doublets, triplets are allowed

Implications of VLQs

- 😊 VLQs B, T can be directly produced at high enough \sqrt{s}
- 😊 Mixing with known quarks is retained
 - Decays to SM final states
 - Possibility for new source of CP violation
- Mass and Higgs coupling terms cannot have the same structure as known quarks
- 😊 Indirect constraints are loosened, e.g. on ggF

Direct VLQ searches

- VLQ are assumed to decay mostly to 3rd generation quarks
- Branching ratios depend on VLQ masses and mixing parameters

$$T \rightarrow Ht \text{ or } Zt \text{ or } Wb$$

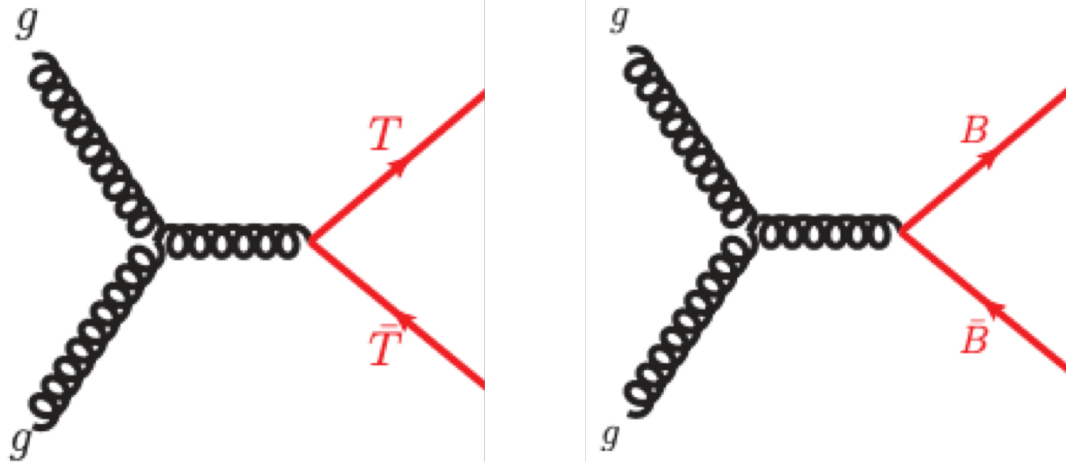

$$B \rightarrow Hb \text{ or } Zb \text{ or } Wt$$

Branching ratios add up to 1.0

Possible extension:
allow decays to non-SM particles

VLQ pair-production

- At high enough \sqrt{s} , VLQ (B/T) cross section is dominated by QCD pair-production
 - At the LHC, this holds for VLQs with mass up to ~ 1 TeV
- Pair-production cross section depends on the VLQ mass (not mixing parameters)

VLQ pair-production

- [2018 ATLAS paper](#) combines many VLQ searches targeting different decays
- Main backgrounds: top-antitop pair production, vector boson + jets

Analysis	$T\bar{T}$ decay	$B\bar{B}$ decay
$H(bb)t + X$ [16]	$HtH\bar{t}$	-
$W(\ell\nu)b + X$ [17]	$WbW\bar{b}$	-
$W(\ell\nu)t + X$ [18]	-	$WtW\bar{t}$
$Z(\nu\nu)t + X$ [19]	$ZtZ\bar{t}$	-
$Z(\ell\ell)t/b + X$ [20]	$ZtZ\bar{t}$	$ZbZ\bar{b}$
Tril./s.s. dilepton [21]	$HtH\bar{t}$	$WtW\bar{t}$
Fully hadronic [22]	$HtH\bar{t}$	$HbH\bar{b}$

VLQ pair-production

- [2018 ATLAS paper](#) combines many VLQ searches targeting different decays
- Main backgrounds: top-antitop pair production, vector boson + jets

Analysis	$T\bar{T}$ decay	$B\bar{B}$ decay
$H(bb)t + X$ [16]	$HtH\bar{t}$	-
$W(\ell\nu)b + X$ [17]	$WbW\bar{b}$	-
$W(\ell\nu)t + X$ [18]	-	$WtW\bar{t}$
$Z(\nu\nu)t + X$ [19]	$ZtZ\bar{t}$	-
$Z(\ell\ell)t/b + X$ [20]	$ZtZ\bar{t}$	$ZbZ\bar{b}$
Tril./s.s. dilepton [21]	$HtH\bar{t}$	$WtW\bar{t}$
Fully hadronic [22]	$HtH\bar{t}$	$HbH\bar{b}$

No VLQ observation in any channel

VLQ pair-production

- Sensitivity depends on VLQ mass and branching ratios

Analysis	$T\bar{T}$ decay	$B\bar{B}$ decay
$H(bb)t + X$ [16]	$HtH\bar{t}$	-
$W(\ell\nu)b + X$ [17]	$WbW\bar{b}$	-
$W(\ell\nu)t + X$ [18]	-	$WtW\bar{t}$
$Z(\nu\nu)t + X$ [19]	$ZtZ\bar{t}$	-
$Z(\ell\ell)t/b + X$ [20]	$ZtZ\bar{t}$	$ZbZ\bar{b}$
Tril./s.s. dilepton [21]	$HtH\bar{t}$	$WtW\bar{t}$
Fully hadronic [22]	$HtH\bar{t}$	$HbH\bar{b}$

- $H(bb)t + X$ is most sensitive to Ht final state
- Sensitivity is worse at high m_T

VLQ pair-production

- Combined limits are set on T and B as a function of BR and mass
 - T singlet excluded at 95% CL for $m_T < 1.3$ TeV,
B singlet for $m_B < 1.2$ TeV

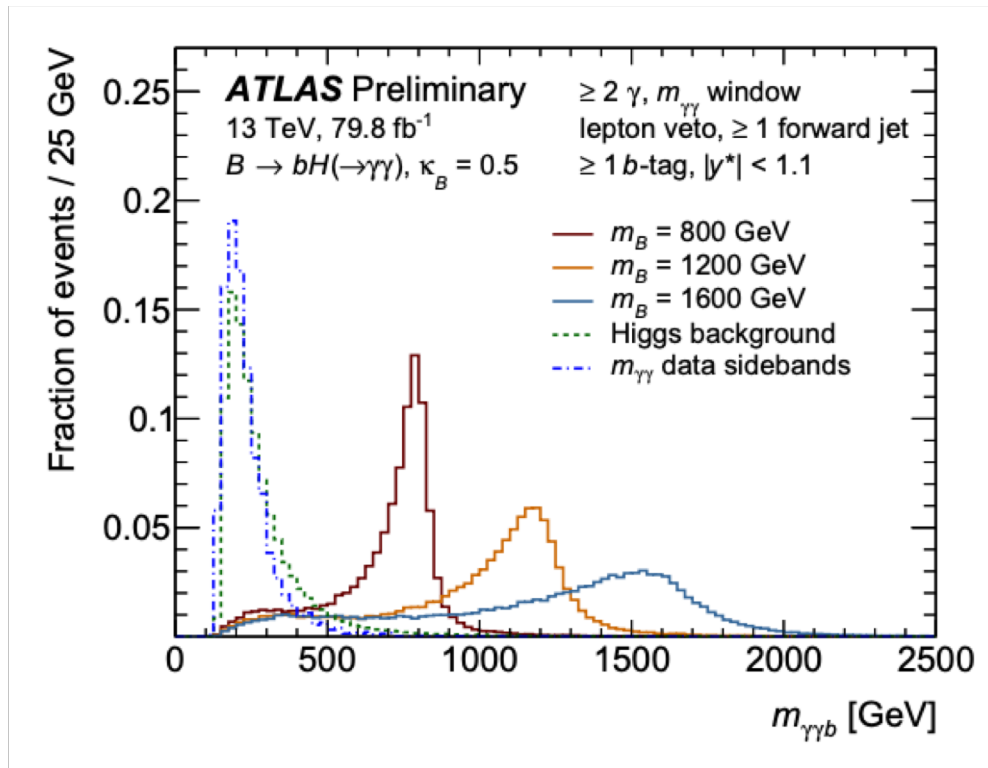

VLQ single-production

- Pair production of heavy VLQs limited by \sqrt{s}
 - Starts to apply at VLQ mass ~ 1 TeV. Already reaching this with current limits!
- Consider single T/B production through electroweak coupling to W, Z, H
 - Cross section depends on VLQ masses *and mixing parameters*
- Example: [2018 ATLAS search](#) for single B to $H(\gamma\gamma)b$

VLQ single-production

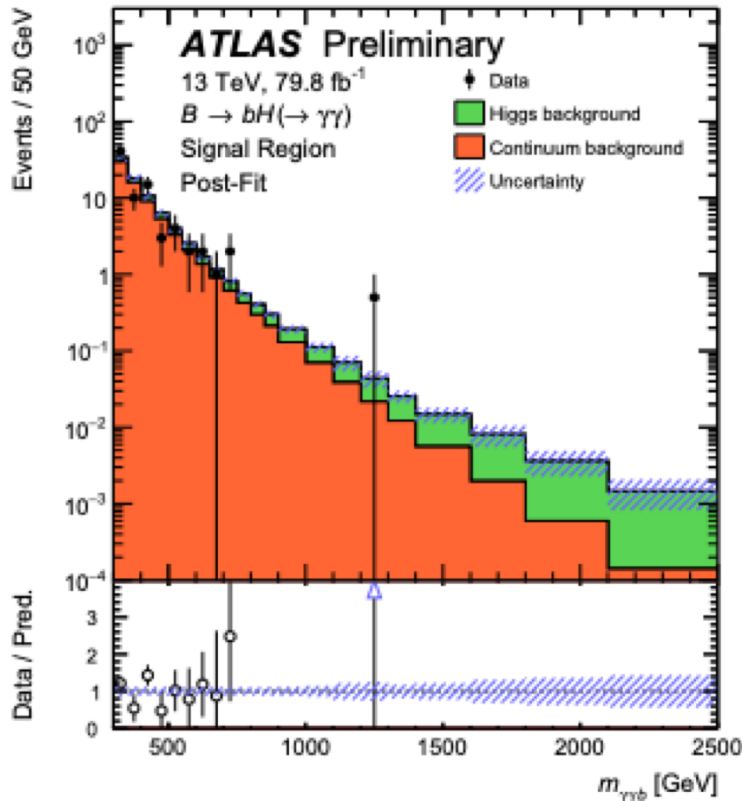

- [2018 ATLAS search](#) for single B to $H(\gamma\gamma)b$

- Require 2 photons with $m_{\gamma\gamma} \sim 125$ GeV
- Require 1 b-jet, 1 light forward jet, no leptons
- Clean channel with smooth background
- B signal shows up as a resonance in $m_{\gamma\gamma b}$

VLQ single-production

- [2018 ATLAS search](#) for single B to $H(\gamma\gamma)b$
- *No VLQ observation*

- Assuming b-B coupling of 0.5, doublet model (B, Y) is excluded at 95% CL up to 1210 GeV
 - Compare to the combined exclusion on the same model of 1150 GeV!

Summary

- 4th generation quarks with Yukawa couplings to Higgs are strongly disfavored
- VLQs are a very viable model of 4th generation quarks!
 - VLQ pair production is an active search area at the LHC
 - Single VLQ production extends mass reach, but requires assumptions on couplings
 - Many final states remain to be explored!
